

HTML - What is the language that is on every website you use?

HTML (**H**yper**T**ext **M**arkup **L**anguage) is the most used Markup language on websites. That means that it is not a programming language, and his only function is to document the items (with tags) that will appear on the website. But, that language can't give style, animations or big functionalities for the items, because this, the HTML is practically always assisted by other languages like CSS (for the style) and JavaScript (for the functionalities). Basically, HTML is the language that makes the base of practically every actual website.

The HTML is originally created by Tim Berners-Lee with a proposit of help him on his problems for communicate and disseminate of researches between him and his group. This combined with the ascension of the public internet attracted a lot of attention for the HTML. The first version of the HTML was created in 1990, and the language continues to be widely used to this day.

Just like said before, that is not a programming language, the only proposit of the HTML is to create a base of a website through tags, after this, programming and style languages are used to implement the website. That is a simple language, and despite its not possible to make a good site with only this, that language is indispensable for whoever wants to create a website.

Website created with only HTML
